Abstract - A magic cricket bat is the bat in which the weight of bat is increased at the point of percussion. Just by increasing the weight at the centre of percussion one can hit the ball very well, and for same effort the ball can drop/travel more distance.

I INTRODUCTION

The World's the famous game is cricket. All cricket players are choosing the bat as per their own choice so that they can play well. If we made available the magic bat, all cricket players will choose the magic bat only.

II DESIGN AND NATIONAL ECONOMY

The design of magic bat and national economy consist of -

1. Increase the weight of bat at centre of percussion ($L/3$ from bottom) e.g. steel channel section is attached on back side of bat. Say the width of channel section is equal to the width of bat. And depth of channel section is equal to the width of bat. The width of flange is say thickness of bat. And the thickness of channel section may be kept different so that cricket players can choose the bat as per their choice. OR
2. Any other method which increases the weight and maintains the centre of gravity of attached material and centre of percussion is same.
3. As ball drops/travels more distance with same effort, because of this there will be changes in cricket game.
i. e. one more extra circle/boundary may be required for eight runs.
4. The stadium size will increase in future.
5. Rural development will become easy.
6. National economy will improve.
