**Abstract-** Harary [4,5] introduced the concepts of sum graph ( $\Sigma$ -graph) and integral sum graph ( $\int\Sigma$ -graph). In this paper, we prove that graphs  $K_1 \square (K_1 \square \cup \square K_2)$  and  $K_1 \square (K_2 \cup K_2)$  are not  $\int\Sigma$ -graphs though they are spanning sub-graph of integral sum graphs  $G_{1,3}$  and  $G_{2,3}$ , respectively. A graph  $G$  is an integral sum graph or  $\int\Sigma$ -graph if the vertices of  $G$  can be labeled with distinct integers so that  $e = uv$  is an edge of  $G$  if and only if the sum of the labels on vertices  $u$  and  $v$  is also a label in  $G$ .

**Keywords –** sum graph or  $\Sigma$ -graph, integral sum graph or  $\int\Sigma$ -graph, maximal sum graph  $G_m$ , integral sum graph  $G_{\Delta n}$ , integral sum graph  $G_{m,n}$ , comparable and non-comparable graphs, semi-group.

## I. INTRODUCTION

The concept of sum graphs and integral sum graphs are introduced by Harary [4,5]. Harary [5] introduced a family of integral sum graphs  $G_{m,n} = K_1 + (G_m + G_n)$  over a set of integers  $\{-n, \dots, -2, -1, 0, 1, 2, \dots, n\}$ . Vilfred [9,10] defined  $G_{m,n}$ , a generalized graph of  $G_{m,n}$  and derived different properties of it. Vilfred proved that  $G_{m,n}$  is a maximal integral sum graph of order  $m+n+1$  for  $m, n \in \mathbb{N} \cup \{0\}$  and the maximal integral sum graphs of order  $2n$  and  $2n+1$  are  $G_{n-1,n}$  and  $G_{n,n}$ , respectively,  $n \in \mathbb{N}$ . Though the graph  $G_{m,n}$  is an integral sum graph for  $m, n \in \mathbb{N} \cup \{0\}$ , all spanning sub graphs of  $G_{m,n}$  need not be integral sum graphs. Establishing a given graph as not an integral sum graph is a difficult problem. In this paper we prove that the graphs  $K_1 \square (K_1 \square \cup \square K_2)$  and  $K_1 \square (K_2 \cup K_2)$  are not integral sum graphs though they are spanning sub-graph of integral sum graphs  $G_{1,3}$  and  $G_{2,3}$ , respectively. See figures 1 and 2. For all basic ideas in graph theory, we follow [3]. Now let us consider some basic definitions and results on sum and integral sum graphs.

Fig.1.  $K_1 + (K_1 \cup K_2)$

Fig.2.  $K_1 + (K_2 \cup K_2)$

**Definition 1.1** [5] A graph  $G$  is an integral sum graph or  $\int\Sigma$ -graph if the vertices of  $G$  can be labeled with distinct integers so that  $uv$  is an edge of  $G$  if and only if the sum of the labels on vertices  $u$  and  $v$  is also a label in  $V(G)$ . If  $G$

is an integral sum graph with respect to a label set  $S$ , then  $G$  can be denoted as  $G = G^+(S)$ .

Chen [1] obtained several properties of the integral sum labeling of a graph  $G$  with  $\Delta(G) < |V(G)| - 1$ . Nicholas, Somasundaram and Vilfred [6] studied the general properties of connected integral sum graph  $G$  with  $\Delta(G) = |V(G)| - 1$ . Vilfred [9,10] defined and studied maximal integral sum graphs. We give below some important properties of integral sum graphs.

**Definition 1.2** Let  $G$  be a connected graph with maximum degree  $\Delta(G) = |V(G)| - 1$ . Define  $V_{\Delta}(G) = \{x \in V(G) / \deg(x) = \Delta(G)\}$ .

**Theorem 1.3** [1] Let  $f$  be an  $\int\Sigma$ -labeling of a non-trivial graph  $G$ . Then  $f(x) \neq 0$  for every vertex  $x$  of  $G$  if and only if  $\Delta(G) < |V(G)| - 1$ . ■

**Theorem 1.4** [6] Let  $f$  be an  $\int\Sigma$ -labeling of a connected graph  $G$  and  $x, u, v, w \in V(G)$ . If  $f(u) \neq -f(x)$ , then for each  $v \in \square(u)$  such that  $f(u) + f(v) = f(w)$ , either  $w = x$  or  $xw \in E(G)$ . ■

**Theorem 1.5** [6] Let  $f$  be an  $\int\Sigma$ -labeling of a connected graph  $G$  with  $\Delta(G) = |V(G)| - 1$ . If  $|V_{\Delta}(G)| \geq 2$ , then

- (i) There exists a vertex  $x \in V_{\Delta}(G)$  such that  $f(x) = 0$  and
- (ii) For every vertex  $y \in V_{\Delta}(G) \setminus \{x\}$ , there exists a vertex  $y' \in \square(V(G) \setminus V_{\Delta}(G))$  such that  $f(y) + f(y') = 0$ . ■

**Theorem 1.6** [6] Let  $f$  be an  $\int\Sigma$ -labeling of a connected graph  $G$  of order  $k+2$  with  $\Delta(G) = |V(G)| - 1$  and  $|V_{\Delta}(G)| \geq 2$ . If  $y \in V_{\Delta}(G)$  such that  $f(y) \neq 0$ , then for every vertex  $u \in V(G)$ ,  $f(u) = r \cdot f(y)$  where  $r \in \{0, 1, -1, -2, \dots, -k\}$ ,  $k \in \mathbb{N}$ . ■

**Theorem 1.7** [6] If  $G (\neq K_3)$  is a connected  $\int\Sigma$ -graph with  $\Delta(G) = |V(G)| - 1$ , then  $|V_{\Delta}(G)| \leq 2$ . ■

**Theorem 1.8** [6] Integral sum graphs  $G (\neq K_3)$  of order  $n$  with  $|V_{\Delta}(G)| = 2$  are unique up to isomorphism. (This graph of order  $n$  is denoted by  $G_{\Delta n}$ .) ■

Definition 1.9 [10] Let  $G_{m,n} = G^+(S)$  where  $S = \{-m, -m+1, \dots, -2, -1, 0, 1, 2, \dots, n\}$ ,  $m, n \in \mathbb{N} \cup \{0\}$ . Clearly,  $G_{m,n} = K_1 + (G_m + G_n) = G_{n,m}$  is an integral sum graph,  $m, n \in \mathbb{N} \cup \{0\}$ . Without loss of generality, hereafter, we consider  $m \leq n$  for the graph  $G_{m,n}$ . Integral sum graphs  $G_{4,4}$  and  $G_{4,5}$  are given in figures 3 and 4.

Fig.3.  $G_{4,4}$

Fig.4.  $G_{4,5}$

Theorem 1.10 [10]  $G_{m,n}$  is an integral sum graph for  $m, n \in \mathbb{N} \cup \{0\}$  and is a maximal integral sum graph for  $m, n \in \mathbb{N}$ . The maximal integral sum graphs of order  $2n$  and  $2n+1$  are  $G_{n-1,n}$  and  $G_{n,n}$ , respectively,  $n \in \mathbb{N}$ .

For further readings on graph labeling problems refer [2].

## II. MAIN RESULTS

Graph  $G_{m,n} = K_1 + (G_m + G_n)$  is an integral sum graph form,  $m, n \in \mathbb{N} \cup \{0\}$ , [10]. An interesting problem is given two graphs,  $G$  and  $H$ , whether  $K_1 + (G + H)$  is an integral sum graph or not? A special case of the above problem is the case in which  $G$  and  $H$  are either sum or integral sum graphs. The answer to the above problem seems to be difficult. Graphs  $K_1 + (K_1 + K_2)$  and  $K_1 + (K_2 + K_2)$  are  $\int \Sigma$ -graphs, see figures 1 and 2., whereas  $K_1 + (K_1 + K_3)$  and  $K_1 + (K_2 + K_3)$  are not  $\int \Sigma$ -graphs, see problems 1 and 2. Clearly the two graphs are spanning sub-graph of integral sum graphs  $G_{1,3}$  and  $G_{2,3}$ , respectively.

Fig.5.  $G = K_1 + (K_1 \cup K_3)$

Fig.6.  $G = K_1 + (K_2 \cup K_3)$

Problem 2.1 The graph  $K_1 + (K_1 \cup K_3)$  is not an  $\int \Sigma$ -graph.

Solution

Let  $G = K_1 + (K_1 \cup K_3)$  and  $V(G) = \{u_1, u_2, u_3, u_4, u_5\}$ . If possible, let  $f$  be an  $\int \Sigma$  labeling of  $G$ , then using theorem 1.3,  $f(u_1) = 0$ . Let  $f(u_2) = a$ ,  $f(u_3) = b$ ,  $f(u_4) = c$  and  $f(u_5) = d$  where  $0, a, b, c, d$  are all distinct integers. See figure 5.

Therefore,  $\{0, a, b, c, d\} = \{0, a, b, c, d, a+b, b+c, c+a\}$  where  $a+b$ ,  $b+c$  and  $c+a$  are all different. This implies, two of them are neither equal nor equal to 0 or  $d$ . This implies, the three values are 0,  $d$  and the third being one of  $a, b, c$  in some order. Let  $a+b = 0$ ,  $b+c = d$  and (then)  $a+c = b$ . All other cases are similar to the above case only.

This implies,  $b = -a = a+c$  which implies,  $c = -2a$ . This implies,  $d = -3a$  which implies,  $a+d = -2a = c$ . This implies,  $a$  and  $d$  are adjacent in  $G$  which is a contradiction. Hence the graph  $K_1 + (K_1 \cup K_3)$  is not an  $\int \Sigma$ -graph. ■

Problem 2.2 The graph  $G = K_1 + (K_2 \cup K_3)$  is not an  $\int \Sigma$  graph

Solution Let  $G = K_1 + (K_2 + K_3)$  and  $V(G) = \{u_1, u_2, u_3, u_4, u_5, u_6\}$ . If possible, let  $f$  be an  $\int \Sigma$  labeling of  $G$ .

Then using theorem 1.3,  $f(u_1) = 0$ . Let  $f(u_2) = a$ ,  $f(u_3) = b$ ,  $f(u_4) = c$ ,  $f(u_5) = d$  and  $f(u_6) = e$  where  $0, a, b, c, d, e$  are all distinct integers. See figure 6. Therefore,  $\{0, a, b, c, d, e\} = \{0, a, b, c, d, e, a+b, b+c, c+a, d+e\}$  where  $a+b$ ,  $b+c$  and  $a+c$  are all different. This implies, two of them are neither equal nor equal to 0,  $d$  or  $e$ .

Now let us consider the following possible cases and their sub-cases. All other cases are similar to the above cases only.

1.  $a+b = 0 = d+e$  and  $b+c, c+a \neq 0$  (Two among  $a+b, b+c, c+a, d+e$  are 0.).
  - 1.1  $a+b = 0 = d+e; b+c = a; c+a = d$  (or  $e$ ). In this case, we get,  $b = -a; c = 2a; d = 3a$  and  $b+d = 2a = c$  which implies,  $u_3$  and  $u_5$  are adjacent in  $G$  which is a contradiction. Thus this case is not possible.
  - 1.2  $a+b = 0 = d+e; b+c = d; c+a = e$ . In this case, we get,  $0 = d+e = (b+c)+(c+a) = 2c$  which implies,  $c = 0$ , a contradiction. Hence this case is not possible.
2.  $a+b = 0; b+c, c+a, d+e \neq 0$  (One among  $a+b, b+c, c+a$  is 0 and  $d+e \neq 0$ ).  
 Different possible sub-cases are as follows.
  - 2.1.  $a+b = 0; d+e = a; b+c, c+a \neq 0$ .
    - 2.1.1.  $a+b = 0; d+e = a; b+c = a; c+a = d$  (or  $e$ ).  
 In this case we get,  $c = a-b = 2a; d = c+a = 3a; e = a-d = -2a$  which implies,  $c+e = 0$ . This implies,  $u_4$  and  $u_6$  are adjacent in  $G$  which is a contradiction. Hence this case is not possible.
    - 2.1.2.  $a+b = 0; d+e = a; b+c = d$  (or  $e$ );  $c+a = b$ .  
 In this case we get,  $c = b-a = -2a; d = b+c = -3a$ ;  $e = 4a$ . This implies,  $a+d = -2a = c$ . This implies,  $u_2$  and  $u_5$  are adjacent in  $G$  which is a contradiction. Hence this case is not possible.
    - 2.1.3.  $a+b = 0; d+e = a; b+c = e$ ; (or  $d$ ) and  $c+a = d$ . (or  $e$ ).  
 In this case,  $a = d+e = (c+a)+(b+c) = 2c; d = c+a = 3c; b = -a = -2c$  which implies,  $b+d = c$ . This implies  $u_3$  and  $u_5$  are adjacent in  $G$  which is a contradiction. Hence this case is not possible.
  - 2.2.  $a+b = 0; d+e = c; b+c, c+a \neq 0$ .
    - 2.2.1.  $a+b = 0; d+e = c; b+c = d; b+c = e$ ; (or  $d$ ) and  $c+a = d$ . (or  $e$ ).  
 In this case we get,  $c = d+e = (b+c)+(c+a) = 2c$ . This implies,  $c = 0$  which is a contradiction. Hence this case is not possible.
    - 2.2.2.  $a+b = 0; d+e = c; b+c = a; c+a = d$ . (or  $e$ ).  
 In this case,  $b = -a; c = a-b = 2a; d = c+a = 3a; e = c-d = -a$ . This implies,  $a+e = 0$  which implies  $u_2$  and  $u_6$  are adjacent in  $G$ . This is a contradiction and hence this case is not possible.
3.  $d+e = 0$  and  $a+b, b+c, c+a \neq 0$  (None of  $a+b, b+c, c+a$  is 0 and  $d+e = 0$ ).  
 In this case,  $a+b, b+c, c+a$  take at the most one value among  $a, b, c$  and two among the three,  $a+b, b+c, c+a$  take values  $d$  and  $e$ . And so let  $a+b = c; b+c = d$  and  $c+a = e$ . This implies,  $0 = d+e = (b+c)+(c+a) = 3c$ . This implies,  $c = 0$  which is a contradiction. Hence this case is not possible.
4.  $a+b, b+c, c+a, d+e \neq 0$  (None of  $a+b, b+c, c+a, d+e$  is 0.).
  - 4.1.  $d+e = a; a+b = d; b+c = a; c+a = e$ .  
 In this case,  $a = d+e = (a+b)+(c+a) = 3a$ . This implies,  $a = 0$  which is a contradiction. Hence this case is not possible.
  - 4.2.  $d+e = a; a+b = c; b+c = e; c+a = d$ .  
 In this case,  $a = d+e = (c+a)+(b+c) = 3c; b = c-a = -2c$  and  $e = b+c = -c$ . This implies,  $c+e = 0$  which implies,  $u_4$  and  $u_6$  are adjacent in  $G$ . This is a contradiction. Hence this case is not possible.

Thus in all possible cases we get a contradiction and hence  $\int \Sigma$  labeling doesn't exist for the graph  $G = K_1+(K_2 \cup K_3)$ . Hence the graph  $K_1+(K_2 \cup K_3)$  is not an  $\int \Sigma$  graph. ■

Remark 2.3  $G_{k,m-k}$  are the only maximal  $\int \Sigma$ -graphs of order  $m+1$  having at least one of its vertices is of degree  $m, m, k+1, m-k+1 \in \mathbb{N}$ . Though any proper spanning super graph of a maximal  $\int \Sigma$ -graph need not be an  $\int \Sigma$ -graph, the converse part is not known. For example,  $K_1+(K_1 \cup K_2)$  and  $K_1+(K_2 \cup K_3)$  are not  $\int \Sigma$ -graphs. Secondly whether  $G_{k,m-k}$ 's are the only maximal  $\int \Sigma$ -graphs of order  $m+1, m, k+1, m-k+1 \in \mathbb{N}$ . □ □ □ Think when the graph  $K_1+(G \cup H)$  is an  $\int \Sigma$ -graph?

Remark 2.4 Let  $u$  be a vertex of degree  $n-1$  in an  $\int \Sigma$ -graph  $G$  of order  $n \geq 3$ . Clearly,  $G \neq K_n$  for  $n \geq 3$ . Then by adding a new edge  $e$ , by joining two non-adjacent vertices of  $G$ , to  $G$  and joining a new vertex  $v$  with  $u$ , we may think that the resultant graph  $H$  is also an  $\int \Sigma$ -graph. But it is not always the case. The graph  $G = K_{1,2} = K_3-e$  and its new graph  $H = K_1+(K_1 \cup K_2)$  are  $\int \Sigma$ -graphs whereas  $G = K_4-e$  is an  $\int \Sigma$ -graph but its new graph  $H = K_1+(K_1 \cup K_3)$  is not an  $\int \Sigma$ -graph. See figures 7,8,9 and 10 and problem 2.1. But the general result is not known.

$$0 \qquad u = 0 \quad v = 3 \qquad u = 0 \qquad u \quad v$$
